

The effect of interpersonal relationships of the personality traits of a private hospital in the health care

Ayşe Tansu

Istanbul Rumeli University, Turkey

ABSTRACT

This study is planned, as a descriptive and seeking relation, to investigate effects of personality traits of interpersonal relations of doctors nurses and other health professionals of private hospital who has intensive interpersonal relations during work. For data collection Information form which is based on literature is developed by researcher, Interpersonal Relations Scale, A Type Personality Scale are used and for data evaluation Chi-Square Test, Student's T test, one way ANOVA, post hoc further analysis test. In the study, it was found that the A-type personality traits of the health workers benefited from the highest mid-level services in the sub-dimensions (30.990 ± 7.087), while the lowest average levels of social activities (6.827 ± 2.548) were found. The highest score average of the sub-dimensions of interpersonal relationships of health workers was found to be in "Feeder Relationship Style lard ($32,207 \pm 6,186$).

As a result of this study, first of all, studies are provided to know and recognize personality traits of health professionals, to motivate individuals "effective leadership" model is actualized, opportunity is given to workers about education for adaptation to job and to be productive are suggested. Keeping guidance and psychological counseling effective and active this provides positive outcomes such as improving flexible programs which individuals personality make positive and health professionals take time of themselves, their families and their hobbies.
